

Review on kinematic and cognitive load –

For our website, we try to have a minimalistic approach. We believe that this approach is aesthetically pleasing, while offering an easy and enjoyable user experience.

We try to not overload our webpages with too much colour and clutter. by minimising our design, this allow the users to easily identify and access the important parts of the website.

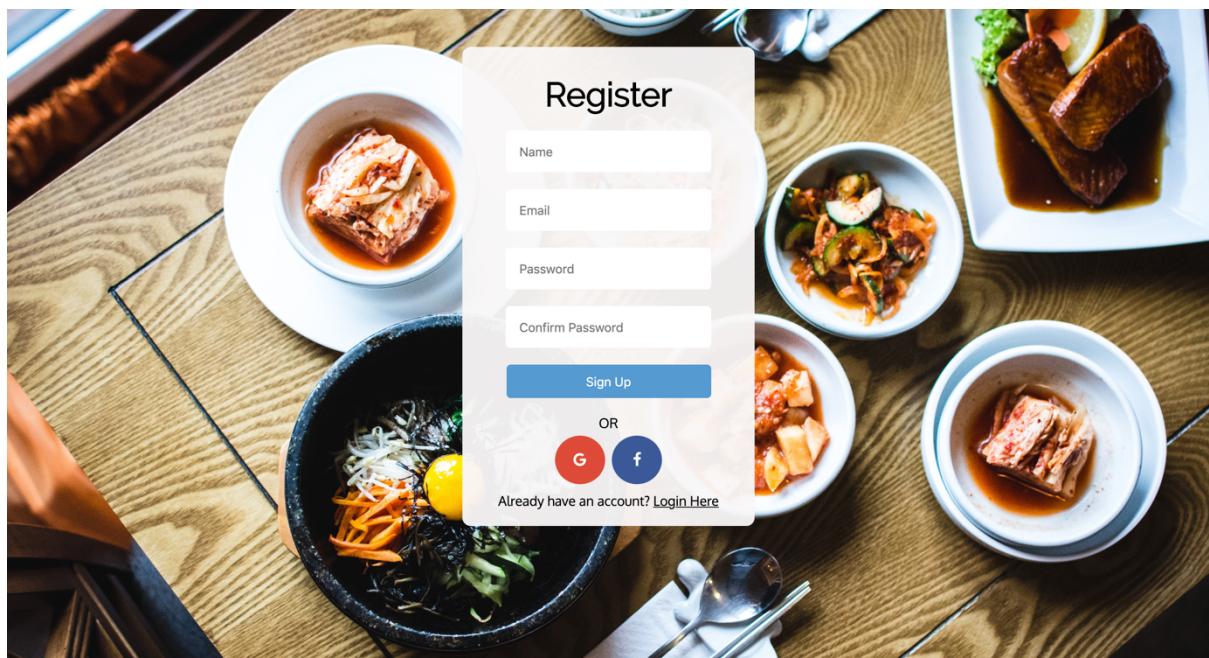

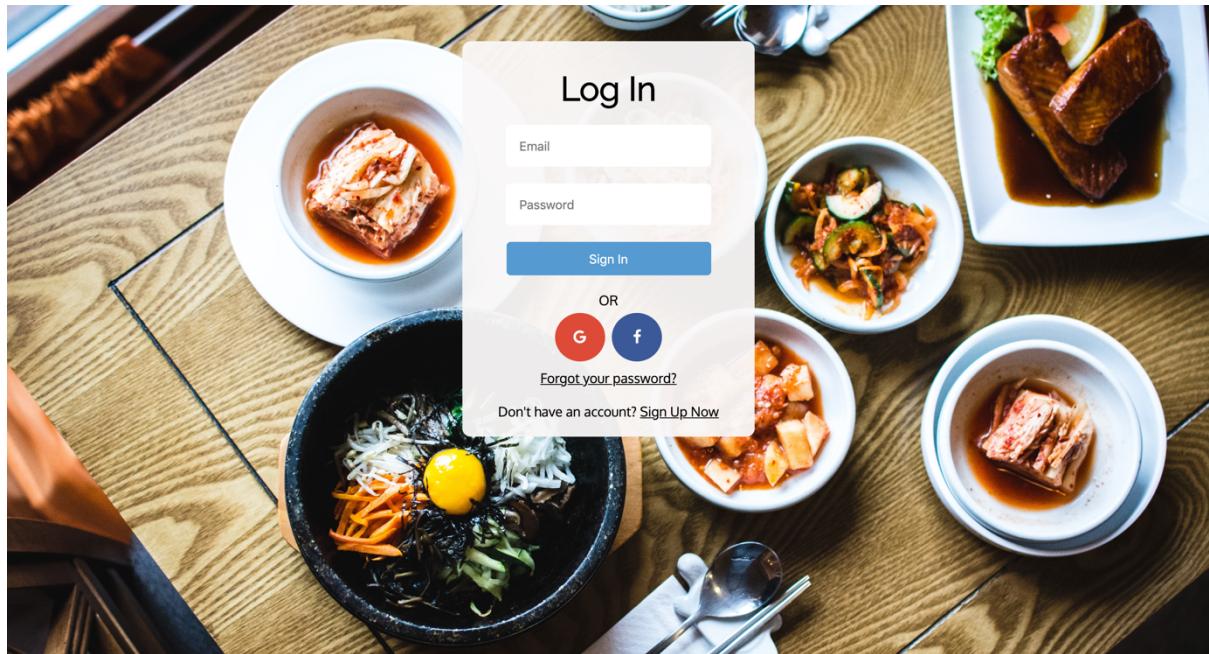

Our index page starts with just a title and a sign in option. This design leaves a strong impression to users due to its aesthetic nature. The user can either scroll or press start booking to continue to the next part of the index page.

A screenshot of a website's search results page. At the top, there's a search bar with the placeholder "Starting Searching" and a magnifying glass icon. Below it, a section titled "Popular restaurants in Adelaide" shows three thumbnail images of restaurant interiors. Further down, a section titled "Cuisines" shows four thumbnail images of food: Asian (ramen), Italian (pizza), English (breakfast), and another English (burger).

In the second part of our index page we provide some features for the users. Users can either begin searching for restaurants, or we provide a suggestions of restaurants that is popular near the users location. We also provide an option for users to begin searching by cuisine.

Since we also want to reduce kinematic load, we do not want users to scroll up and down the webpage too much. This takes too much effort and can be an annoyance. Hence we listed our restaurant recommendations and cuisine selection using a horizontal scroll feature. This allows the users to easily navigate both the cuisine list and popular list at the same time.

Our sign in and register page (for users) follows a very basic and minimalistic style. Everything is positioned in the centre of the page which is easy to identify and navigate. We implemented a feature where users can sign in with either Facebook or google, and we have used the official icons of each option. We made sure that the icons we use is recognisable and understood by all types of

users. We included options for users to navigate from register page to sign in page and vice versa. This helps the user to navigate to the page that they want to be on. We also included a forgot the password options in case if the user have trouble signing in.
